(54) Title: MOBILE COMMUNICATION NETWORK

(57) Abstract: A mobile communication network (N) comprises at least one base transceiver station (BTS) configured to communicate with mobile terminals (T) connected to a corresponding coverage cell. The possibility of communication, which is obtained by means of first communication channels (C), is integrated with the implementation of at least one second communication channel (C') of the Bluetooth® type. According to the arrangement, said at least one second Bluetooth communication channel (C') can permit the communication between said base transceiver station (BTS) and said mobile terminals (T) even if none of said first communication channels (C) is available. Preferential application is in the context of shopping centres, airports, railway stations, stadiums, bus stops, underground train stations, etc., and in general in situations characterised by high possible variations in the traffic level depending on time.
